

Damping Coefficients

Fig. 1: Solid Line: damping timescales as a function of model level for the Rayleigh-friction coefficient in the zonal-momentum equation and the Newtonian-damping coefficient in the thermodynamic equation. Dashed Line: damping timescale for the meridional-momentum equation.

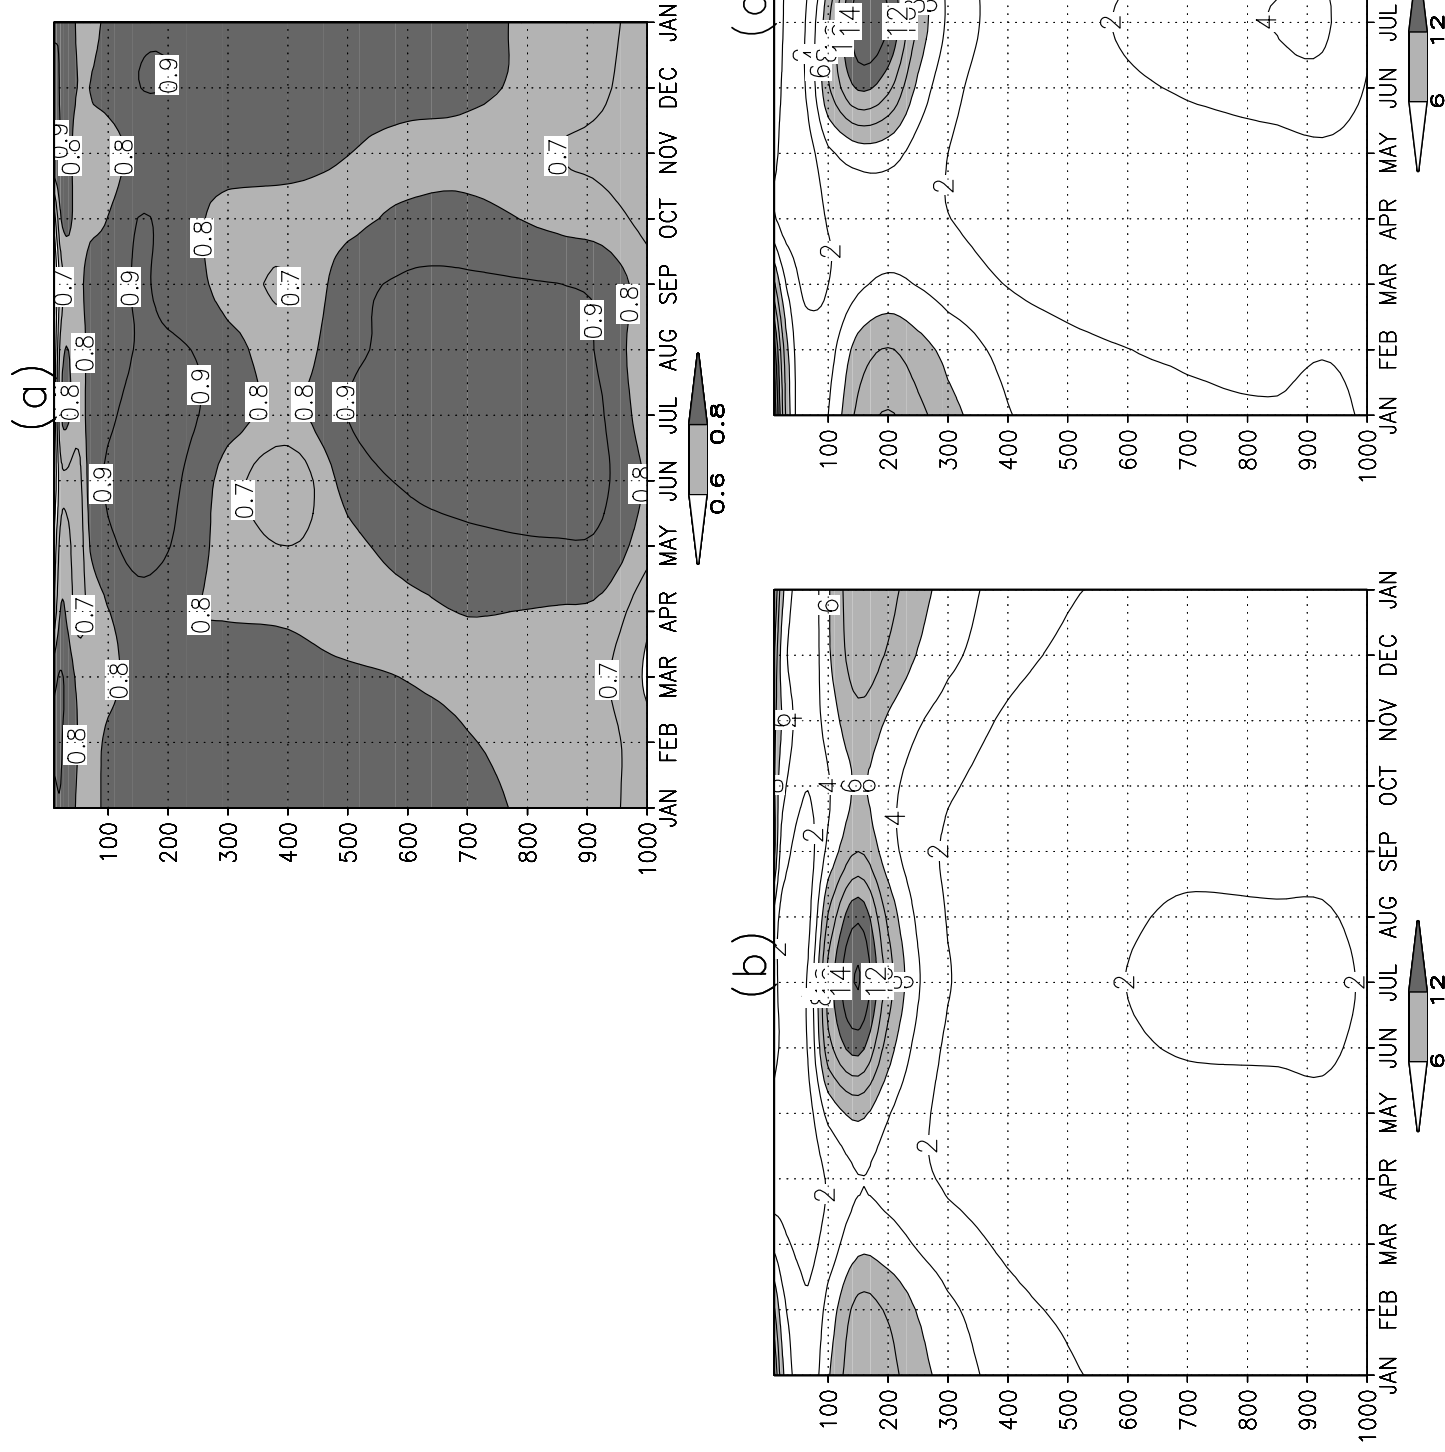

Fig. 2: a) Area weighted spatial pattern correlation between the 52 year average of the NCEP/NCAR reanalysis and Control simulation's horizontal streamfunction as a function of pressure and climatological month. b) Area-weighted global integral of the square of the stationary wave streamfunction amplitude for the NCEP/NCAR reanalysis. c) As in b), but for the control run of the coupled-model. Contour interval: $10^{13} \text{ m}^2 \text{ s}^{-2}$.

250 mb Stationary Wave Streamfunction Response

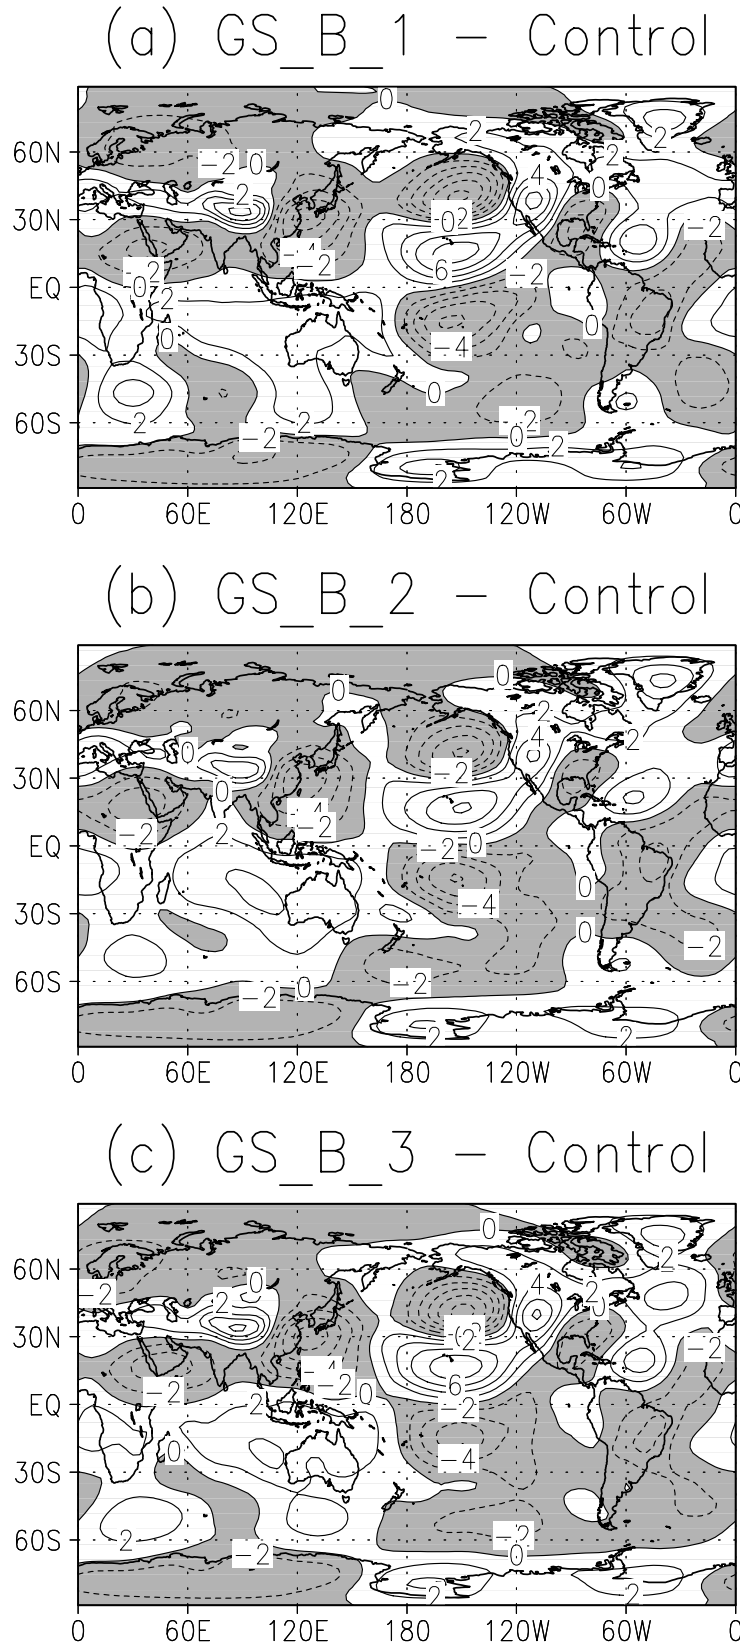

Fig. 3: Differences in stationary wave streamfunction at 250 mb between the climate change scenario integration and the control climate for the three climate change scenario ensemble members described in Section 2.1. Contour interval is $2 \times 10^6 \text{ m}^2 \text{ s}^{-1}$ and negative values are shaded.

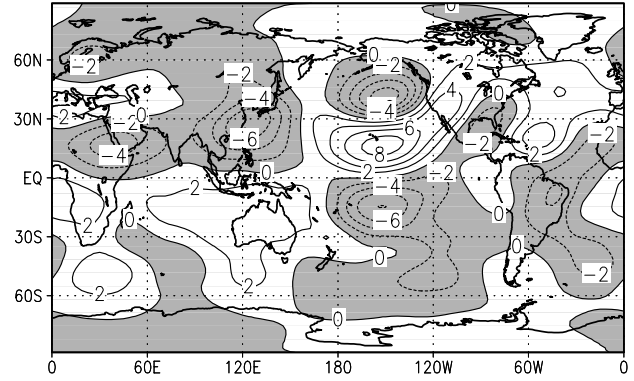

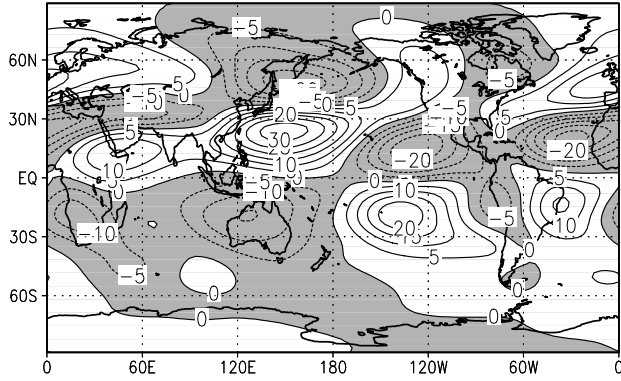

250 mb Stationary Wave Streamfunction

Control

Response

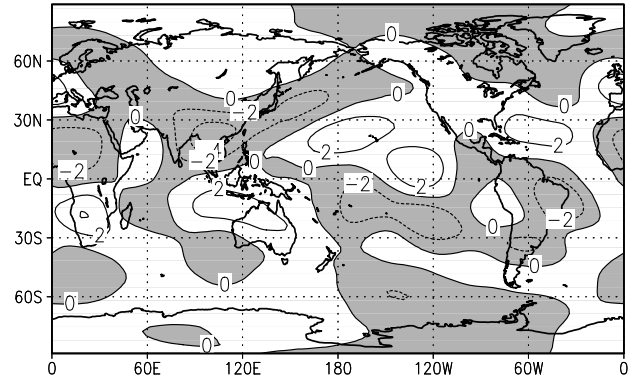

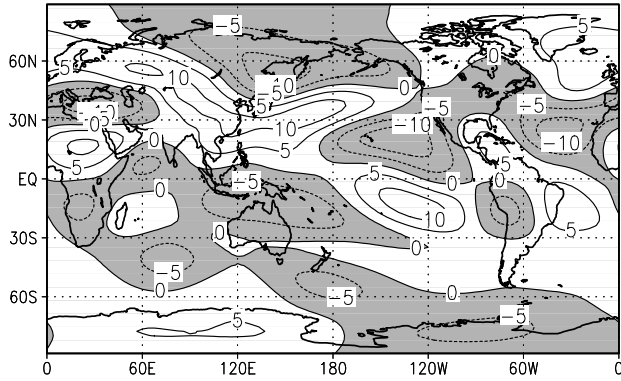

(a) Jan

(b) Jan

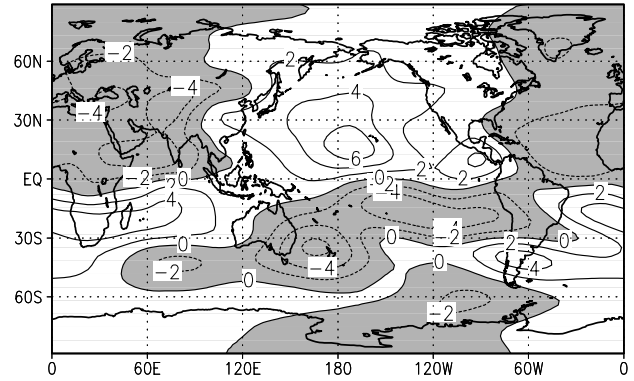

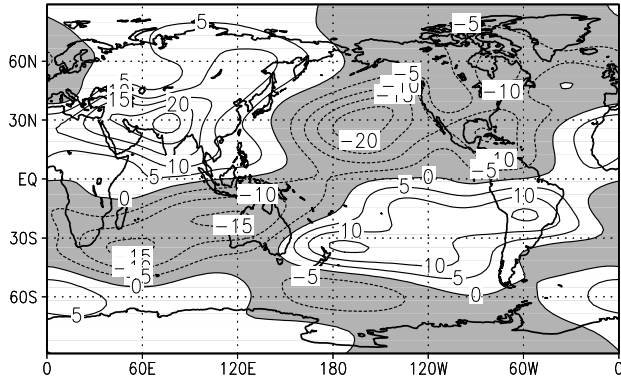

(c) Apr

(d) Apr

(e) Jul

(f) Jul

(g) Oct

(h) Oct

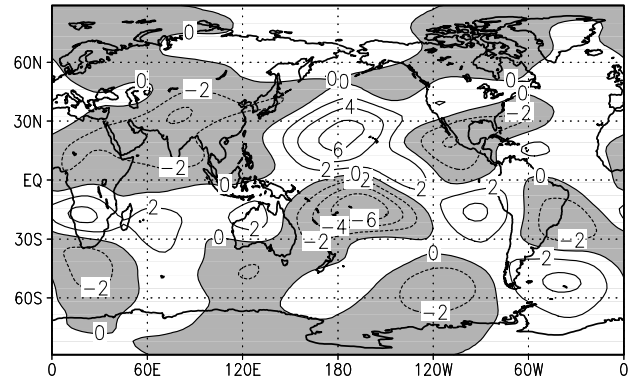

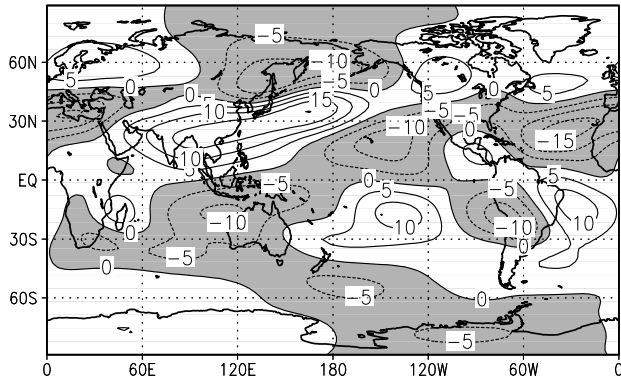

Fig. 4: Stationary wave streamfunction at 250 mb for the control integration (left panels) and the climate change response, that is, the difference between the ensemble average climate change scenario integration and the control integration (right panels) for January (a, b), April (c, d), July (e, f), and October (g, h). Contour intervals are $5 \times 10^6 \text{ m}^2 \text{ s}^{-1}$ for control and $2 \times 10^6 \text{ m}^2 \text{ s}^{-1}$ for the difference. Negative values are shaded.

Correlation Control with Climate Change (a) Global

(b) Northern Hemisphere

(c) Southern Hemisphere

Fig. 5: Area weighted spatial pattern correlation between the control integration's stationary wave streamfunction and the climate change response for (a) the whole globe, (b) the NH, and (c) the SH. Contour interval is 0.1 and correlations greater than 0.3 are heavily shaded and those less than -0.3 are lightly shaded.

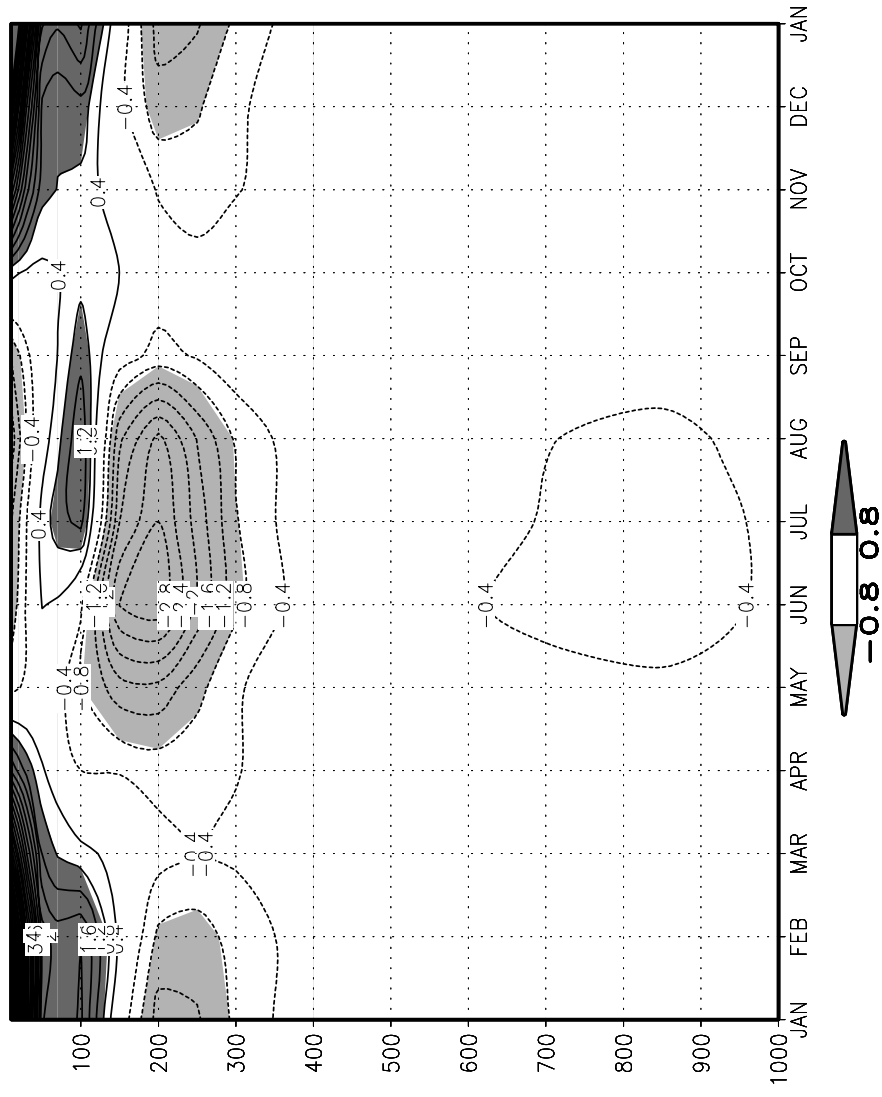

Fig. 6: Area weighted global integral of the square of the stationary wave responses to climate change in streamfunction as a function of pressure and month. Contour interval: $0.4 \times 10^{13} \text{ m}^4 \text{ s}^{-2}$ and values greater than $0.8 \times 10^{13} \text{ m}^4 \text{ s}^{-2}$ are heavily shaded and those less than $-0.8 \times 10^{13} \text{ m}^4 \text{ s}^{-2}$ are lightly shaded.

850 mb Stationary Wave Streamfunction Control Response

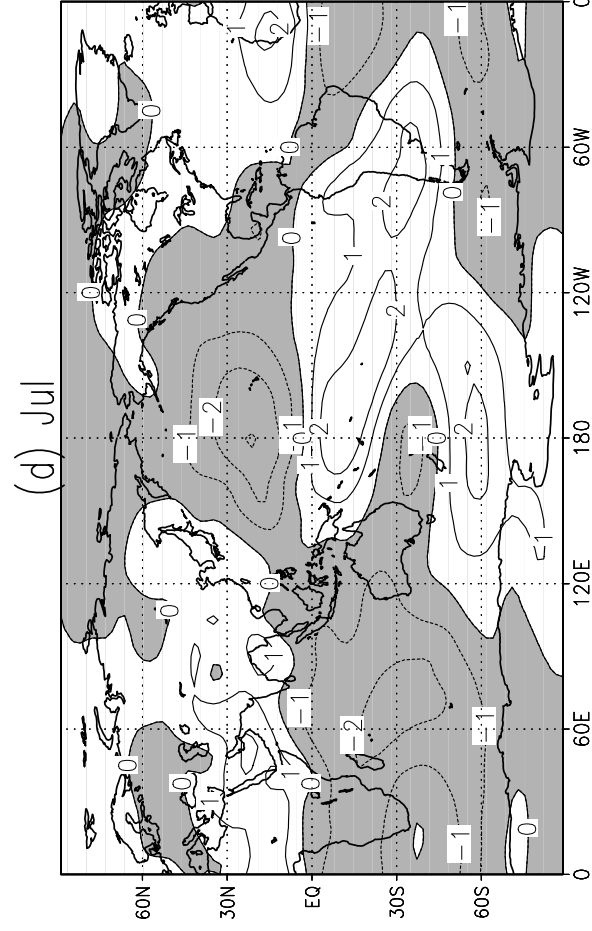

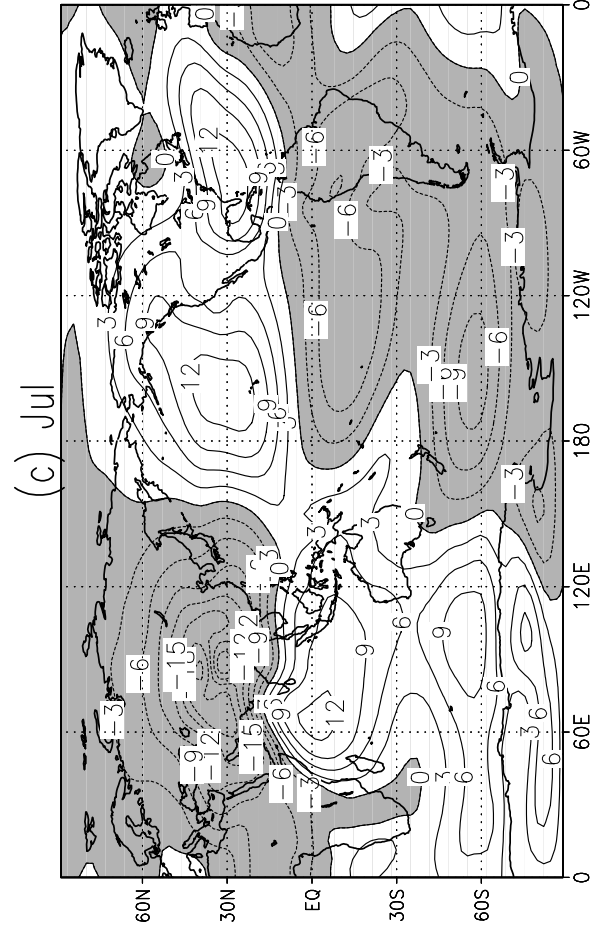

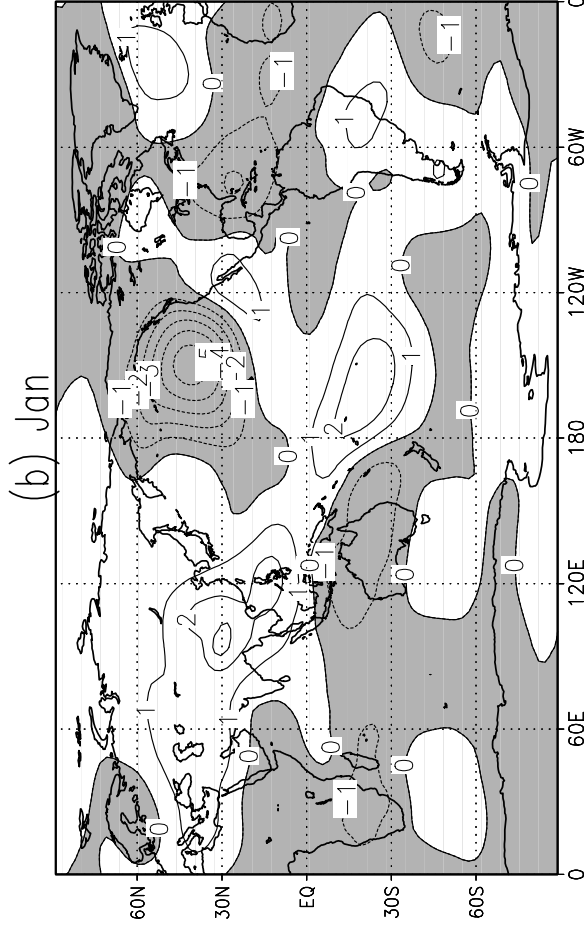

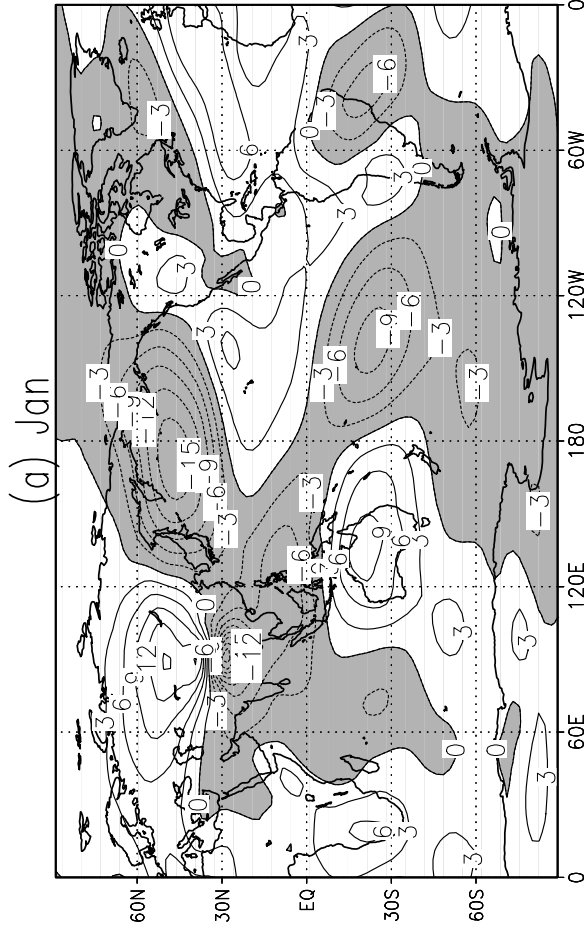

Fig. 7: Stationary wave streamfunction at 250 mb for the control integration (left panels) and the climate change response (right panels) for January (a, b) and July (c, d). Contour intervals are $3 \times 10^6 \text{ m}^2 \text{ s}^{-1}$ for the control and $1 \times 10^6 \text{ m}^2 \text{ s}^{-1}$ for the response. Negative values are shaded.

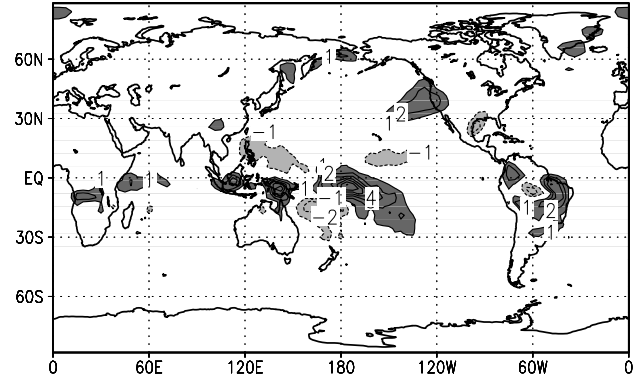

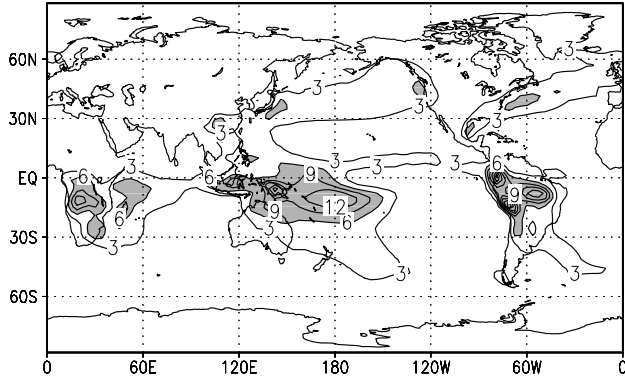

Precipitation

Control

Response

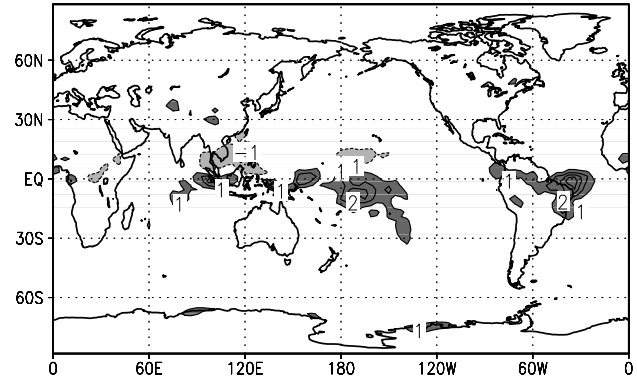

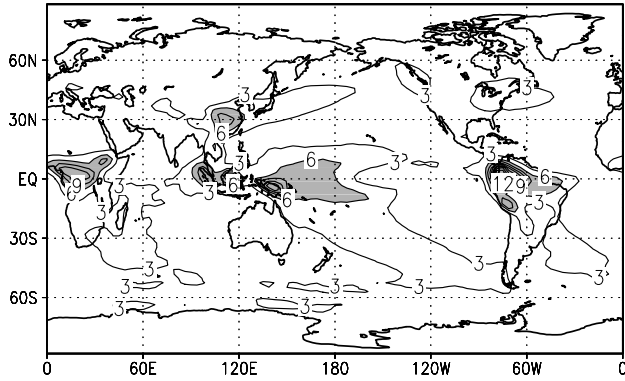

(a) Jan

(b) Jan

(c) Apr

(d) Apr

(e) Jul

(f) Jul

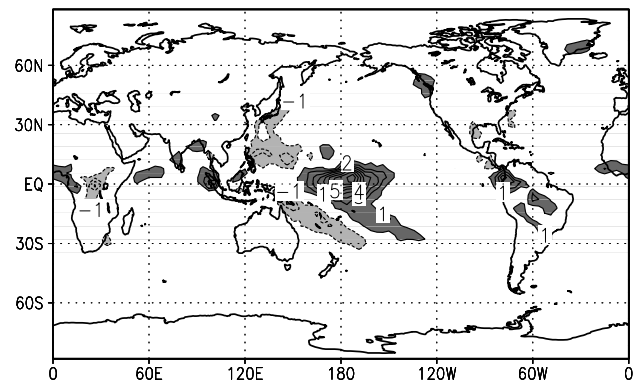

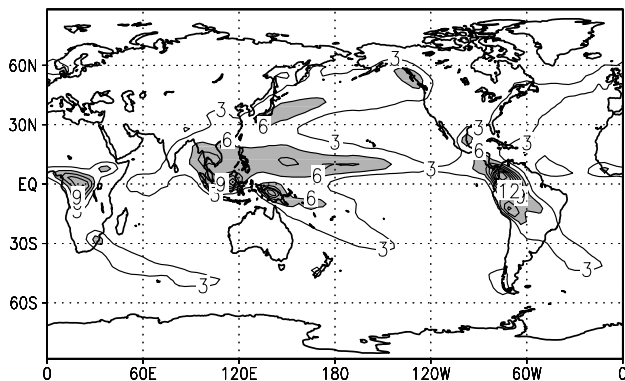

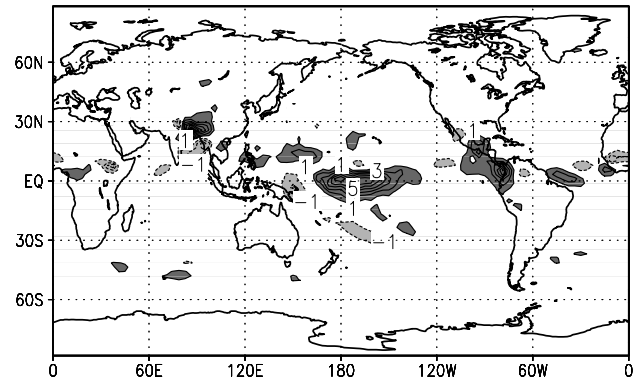

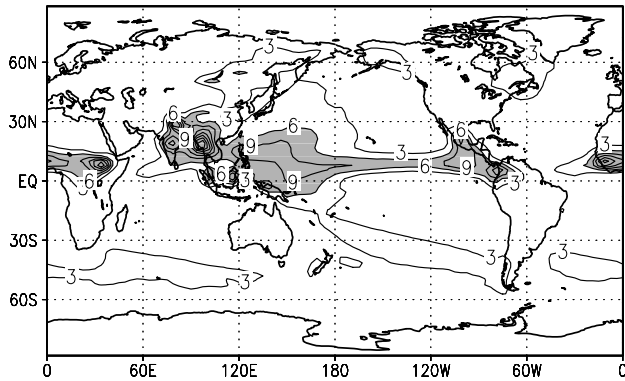

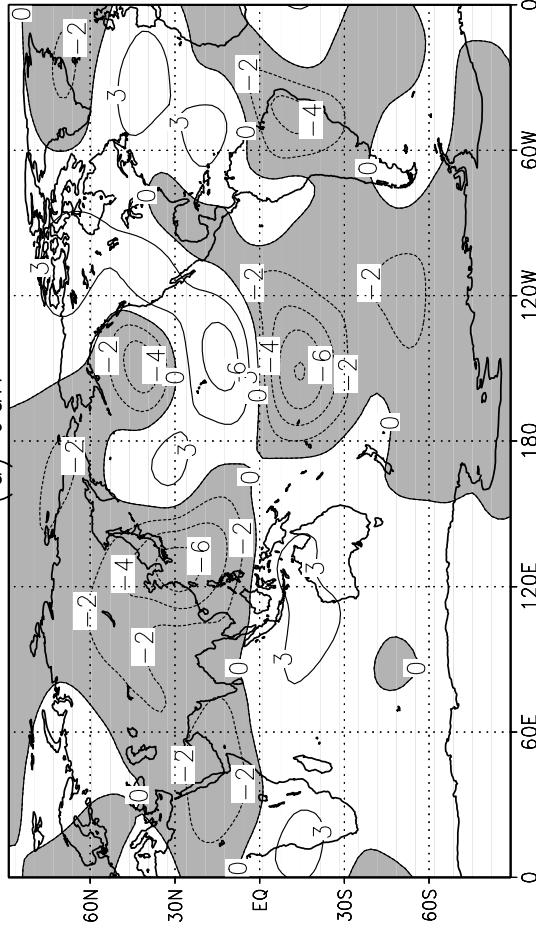

Fig. 8: Precipitation (in mm/day) for the control (left) and for the climate change response (right) for January (a, b), April (c, d), July (e, f), and October (g, h). Contour intervals are 3 mm day⁻¹ for the control and 1 mm day⁻¹ for the response.

$\delta \Psi^*$

250 mb

(a) Jan

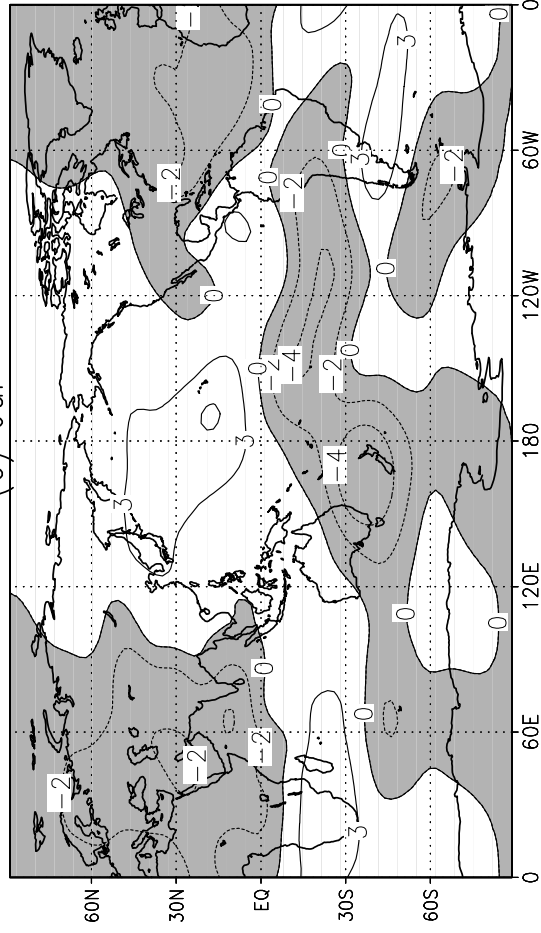

850 mb

(b) Jan

(c) Jul

(d) Jul

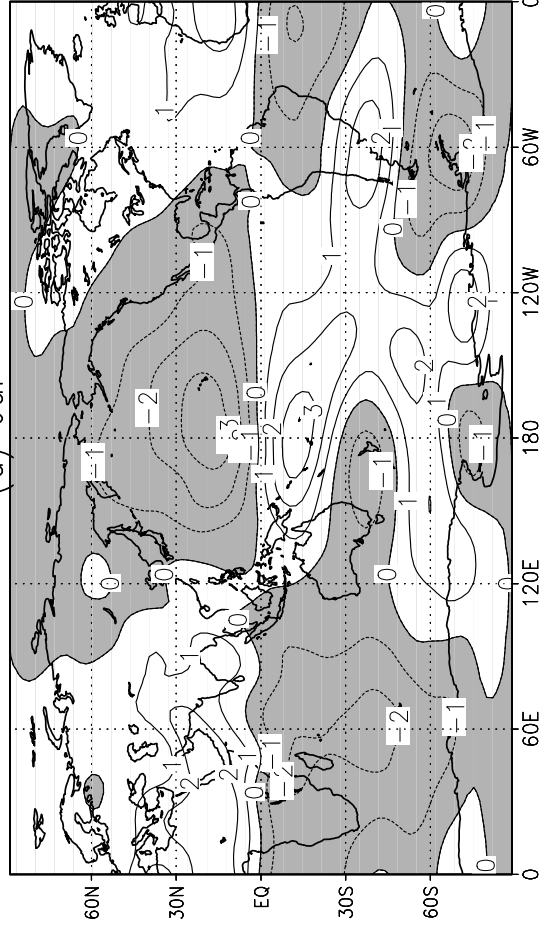

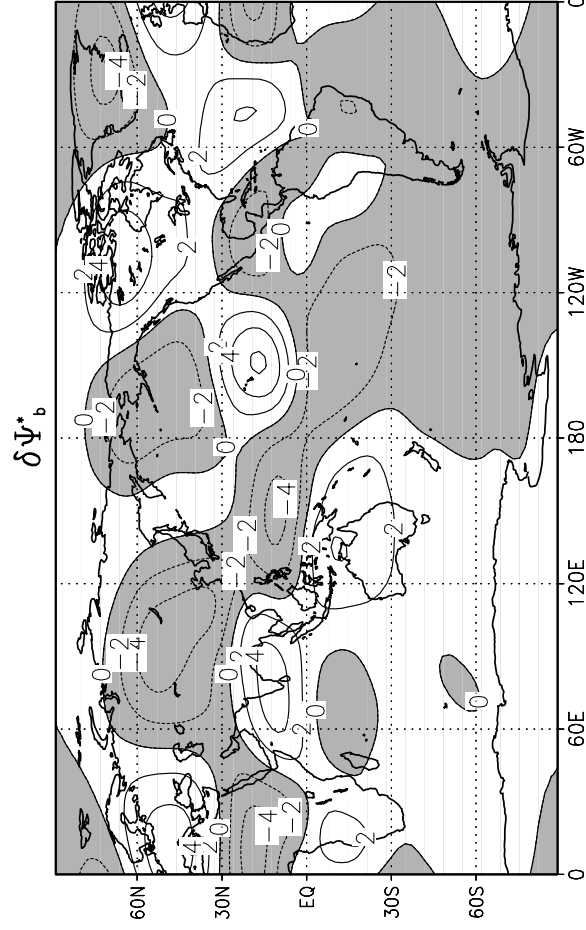

Fig. 9: Stationary wave streamfunction response of the linear model to climate change at 250 mb (left) and 850 mb (right) for January (a, b) and July (c, d). Contour interval is $2 \times 10^6 \text{ m}^2 \text{ s}^{-1}$ for the upper level and $1 \times 10^6 \text{ m}^2 \text{ s}^{-1}$ for the lower level. Negative values are shaded.

Basic State vs. Forcing @ 250mb

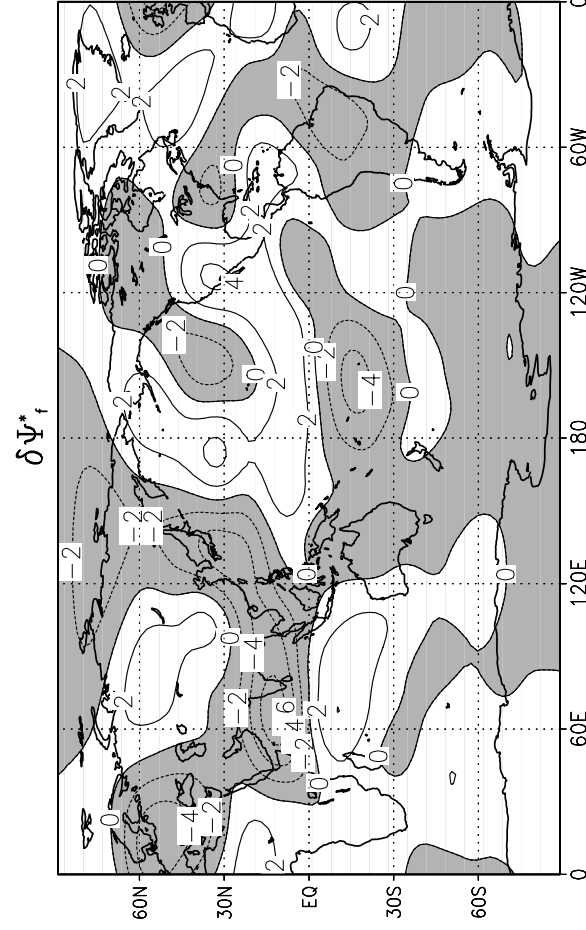

January

July

January

July

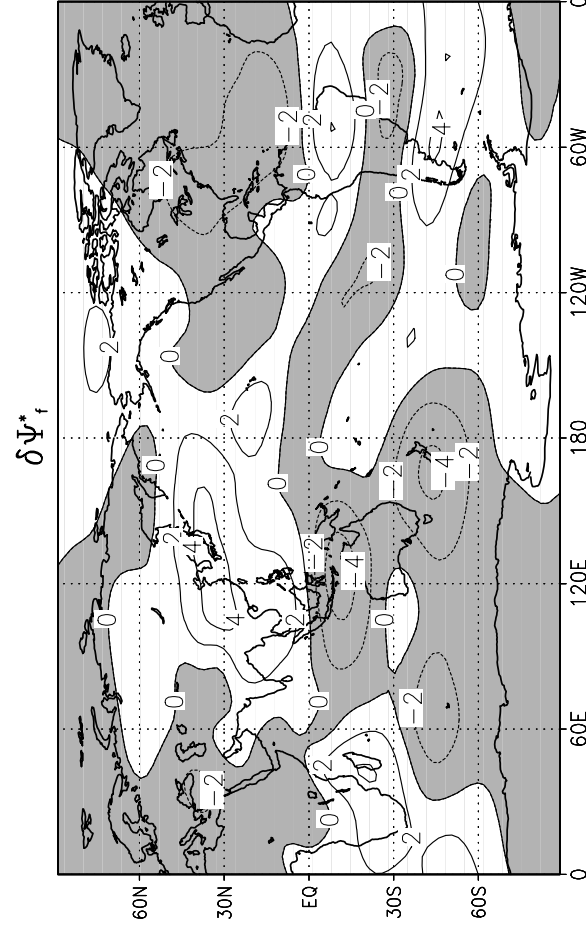

Fig. 10: Stationary wave streamfunction response of the linear model to the climate change induced perturbation to the zonal mean basic state, for January (a) and July (b), and stationary wave streamfunction response of the linear model to the climate change induced stationary wave forcings for January (c) and July (d). Contour interval is $2 \times 10^6 \text{ m}^2 \text{ s}^{-1}$ and negative values are shaded.

Zonal Mean Response

January

(a) Zonal Wind

July

(b) Zonal Wind

(c) Temperature

(d) Temperature

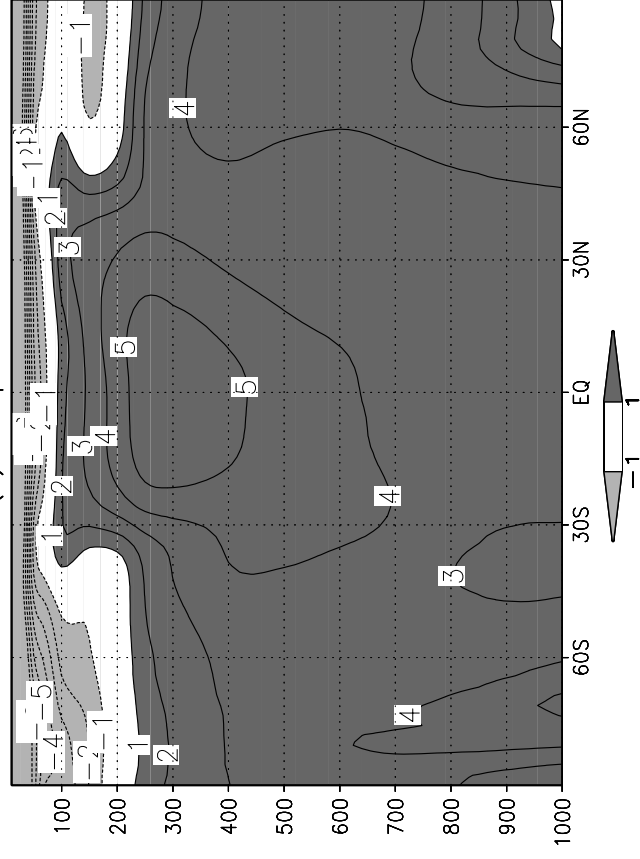

Fig. 11: Zonal mean wind (a, b) and temperature (c, d) response to climate change January (left) and July (right). Contour interval is 1 ms⁻¹ for wind and 1 K for temperature and values greater than 1 are heavily shaded and those less than -1 are lightly shaded.

Linear Model

250 mb Stationary Wave Response

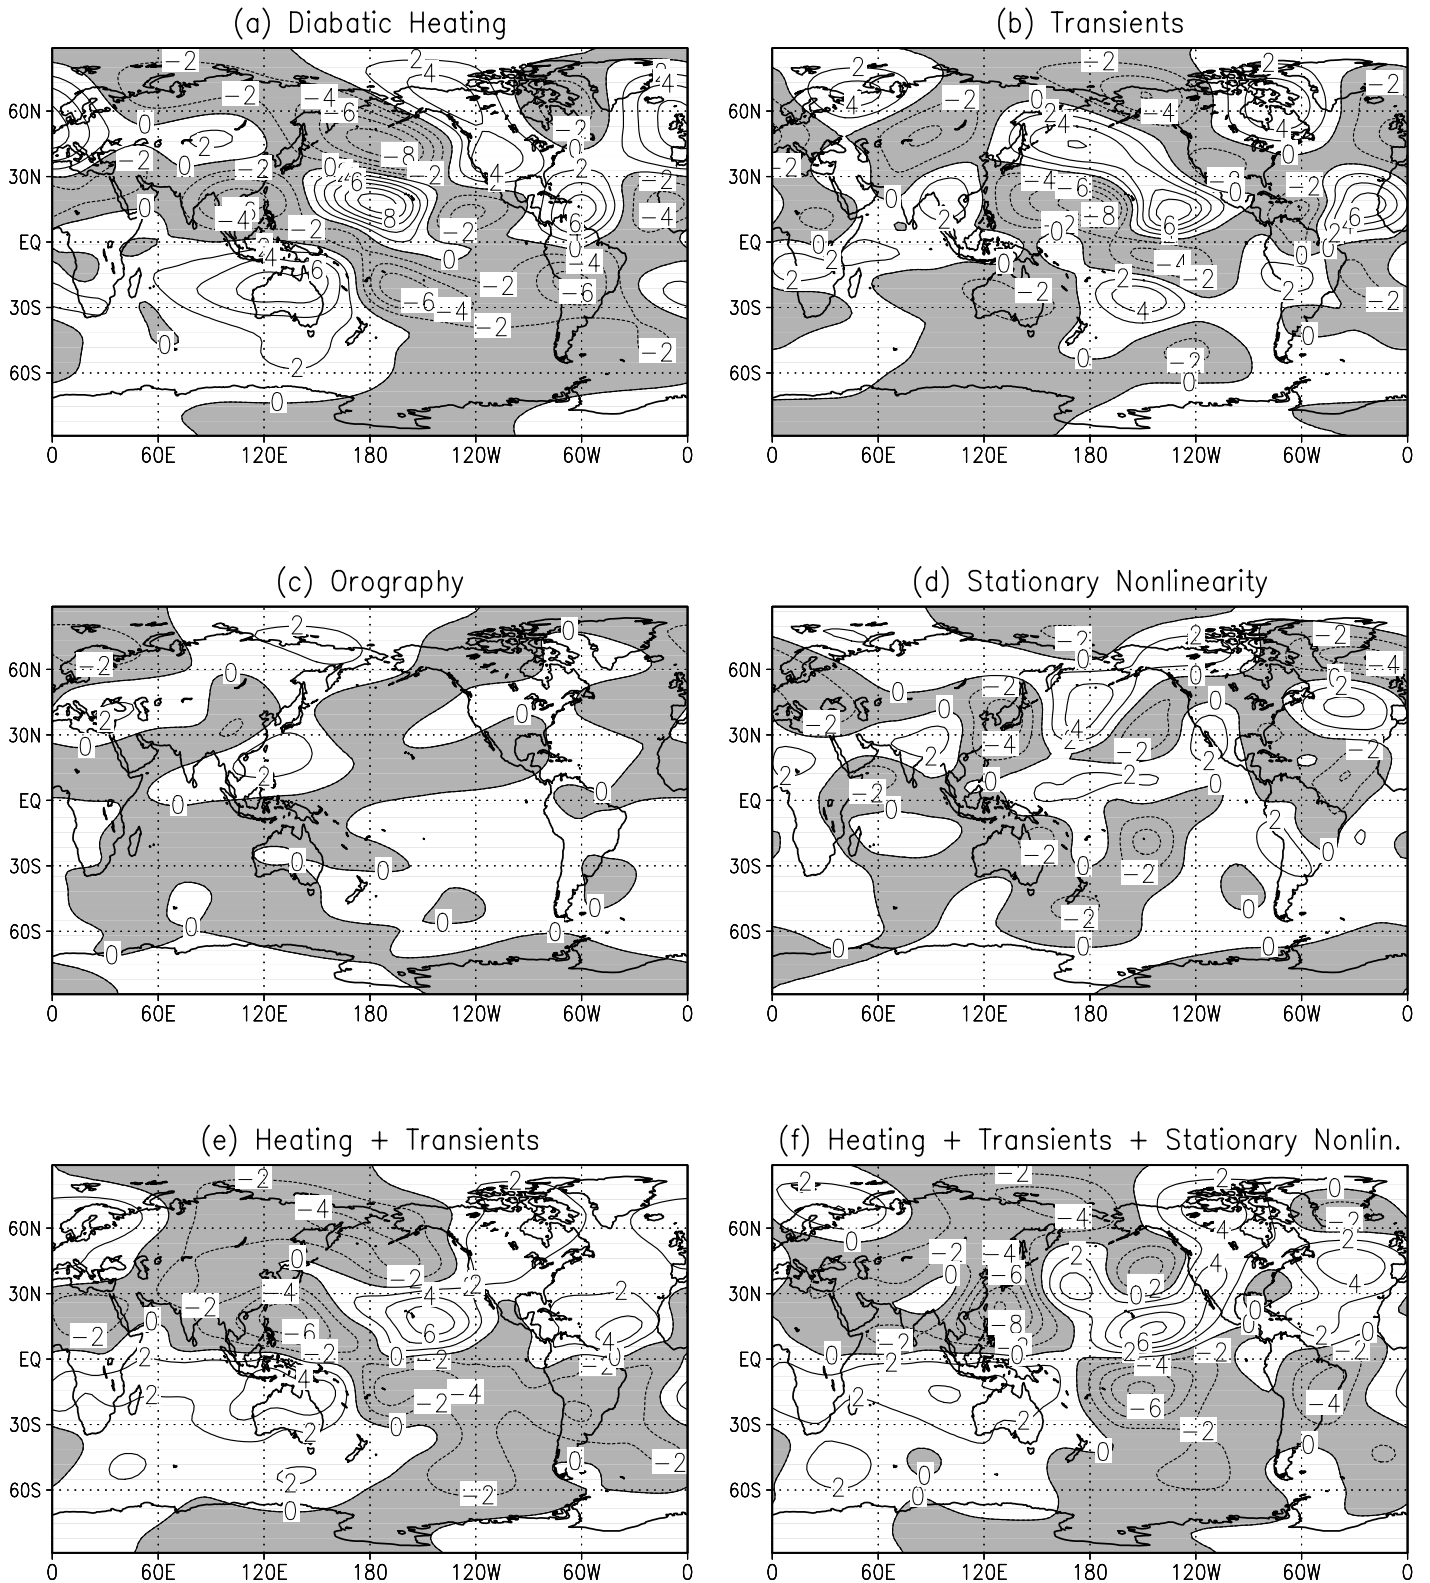

Fig. 12: Linear model response, in January, to forcings from (a) diabatic heating; (b) transients; (c) orography; (d) stationary nonlinearity; (e) the sum of diabatic heating and transient forcing; (f) the sum of diabatic heating, transients and stationary nonlinearity. Contour interval is $2 \times 10^6 \text{ m}^2 \text{ s}^{-1}$. Negative values are shaded.

Linear Model

250 mb Stationary Wave Response

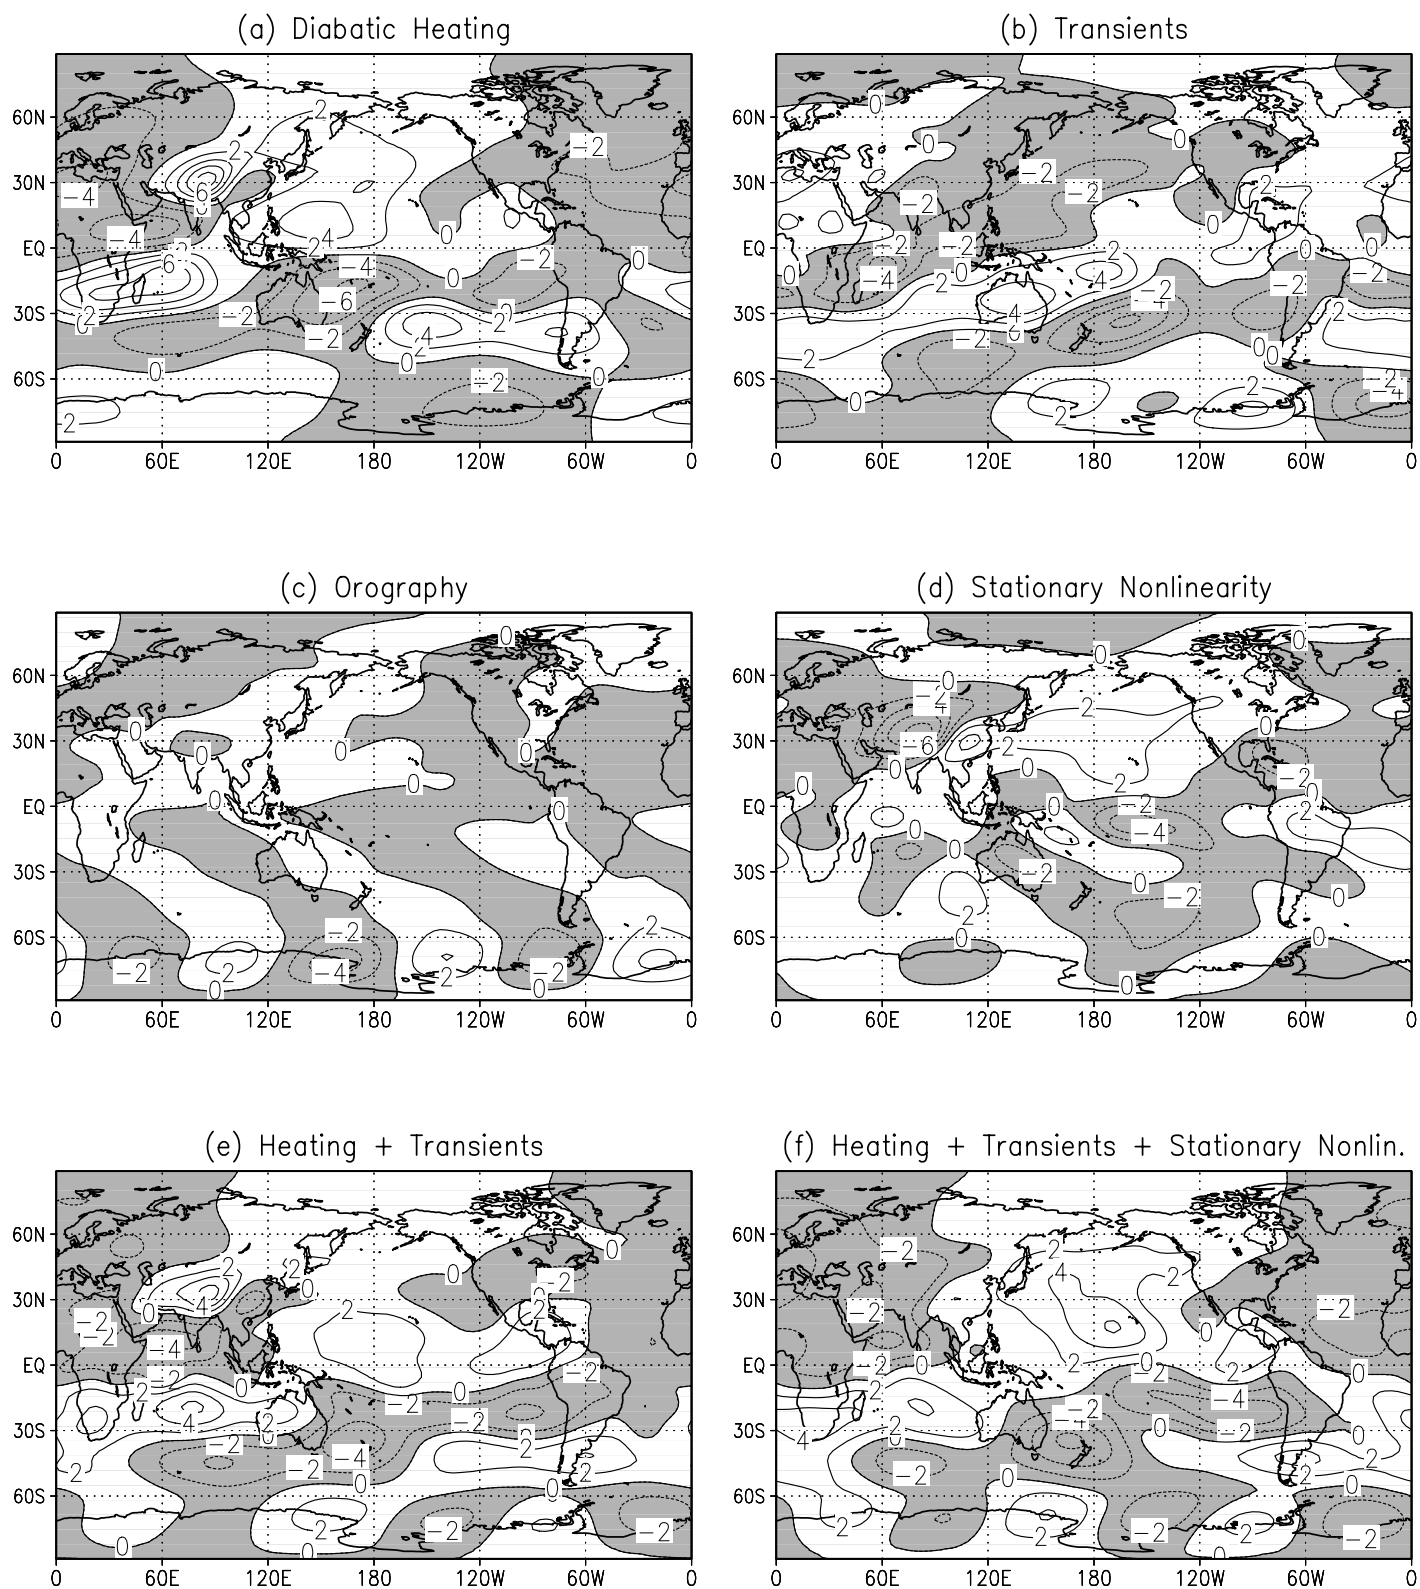

Fig. 13: As Fig. 12, but for July.

Linear Model Response to Heating with Transients Parameterized Upper Level (@250 mb)

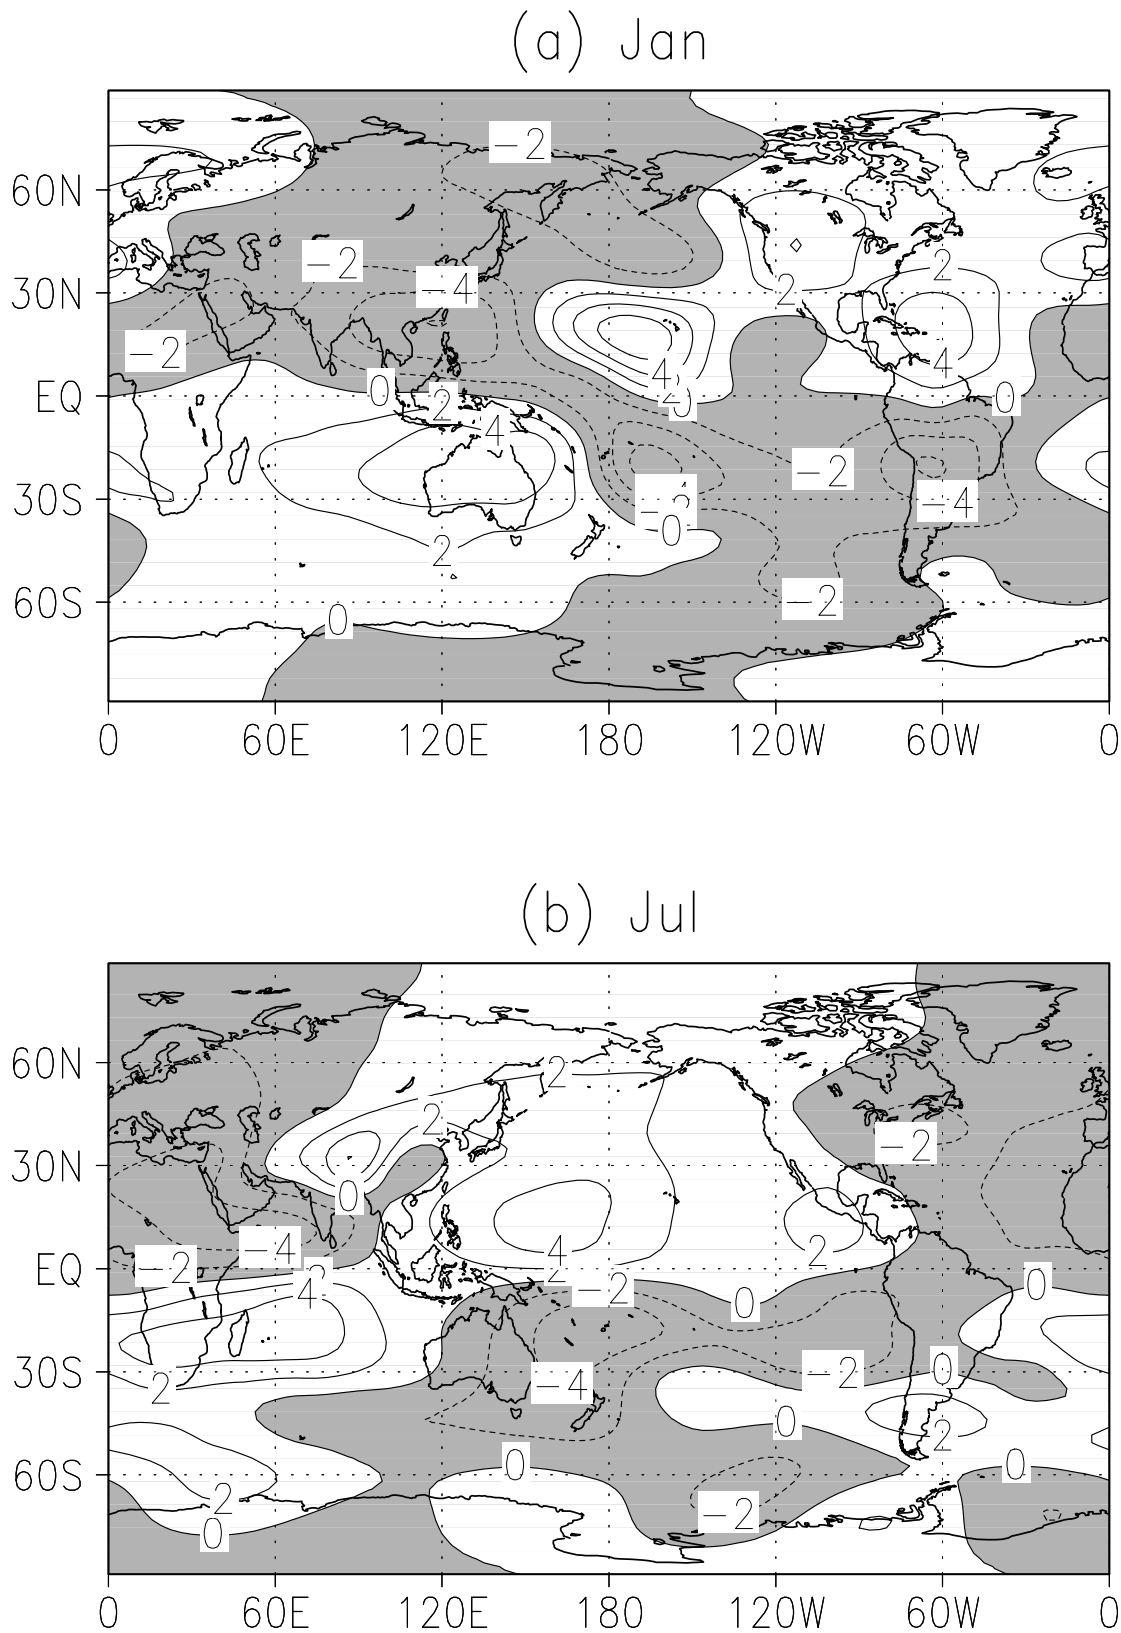

Fig. 14: Linear model response in (a) January and (b) July to diabatic heating and extratropical transients with the effect of tropical transients parameterized as a 5 day damping at 0.17, 0.256, 0.354, 0.46, 0.569 σ levels.
